Just check the JDK software is installed or not on your computer at the correct location, for example, at C:\Program Files\java\jdk11.0.9.Set JAVA_HOME for Windows:Right-click My Computer and select Properties.Go to the Advanced tab and select Environment Variables, and then edit JAVA_HOME to point to the exact location where your JDK software is stored, for example, C:\Program Files\Java\jdk11.0.9 is the default location in windows.Java maintains backward compatibility, so don't worry just download the latest release and you will get all the old and many new features. After Installing the JDK and JRE adds the java command to your command line. You can verify this through the command prompt by the java -version command. In some cases, you need to restart your system after installing the JDK,JDK Version Compile and Run Java Code using JDK.You can use the JDK compiler to convert your Java text file into an executable program. Your Java text segment is converted into bytecode after compilation which carries the .class extension.First, create a Java text file and save it using a name. Here we are saving the file as Hello.java.class Hello{ public static void main (String[] args) { System.out.println("Hello Geek!"); } }After that just simply use the javac command, which is used for the compilation purpose in Java. Please don't forget to provide the full path of your java text file to the command line else you will get an error as The system cannot find the path specified.A Your command should be similar to the given below example where Hello is the file name and the full path to the file is specified before the file name. The path and javac.exe should be inside the quotes.C:\Program Files\Java\jdk-11.0.9\bin\javac.exe C:\Program Files\Java\jdk-11.0.9\bin\Hello.java You can notice now that the Hello.class file is being created in Same directory as Hello.java. Now you can run your code simply using the Java Hello command, which will give you the desired result according to your code. Remember that you do not have to include the .class to run your code.C:\ users \ pinaki \ documents-> java hello world (output) hi geek! The JAR component. JDK contains many useful tools and among them, The most popular after Javac is the Jar tool. The jar file is nothing but a complete package of Java classes. After creating .class files, you can put them together in a .jar, which compresses them and structure them in a predictable way. Now, we convert our Hello.Class to a JAR file. Before proceeding, please note that you should be in the same directory where the Hello.java file has been saved. Now type the command below in the command line. Creating a .jar File: \ Users \ Pinaki \ Documents> â € c : \ Programs \ java \ jdk-11.0.9 \ bin \ jar.exe â € â € â € â € â € â € â € â € â € â € â € â € File Hello.jar Hello.Class Now you can note that the Hello.jar file was created in the same directory using Hello.Class File and Jar.exe. You can use the jar file by adding it to your class path and running the program inside it. Here the -cp stands for ClassPath which helps to add the jar to the same ClassPath. Executing the .jar file java -cp hello.world.jar hello.world\important\jdk\below components of a java.component use javac application the Java compiler converts the source code to java bytecode java The Java App's javap's File Disassembler Charger from Javadoc's Documentation Generator, Jar â â â â â â Java Archiver helps manage files jar.appletviewer's debugging fleets web browser , XJC â â accepts an XML schema and generates Java classes, annotation processing tool, debugger JDB, Java JMC mission control, monitoring and management console iaf e "A'moc ~Asoc inoizatsopmi el aicsaL .itnenopmoc ied enoizeles al rep atamrehcs anu atazilaisiv Arrev :7 assaP .itnavA us cilc iaf e otiniferp olaicsal ,olracifidom rep ovitum nu iah non eS .enoizallatsni id enoizisop al eranoizeles :6 assaP .itnavA us cilc eraf e UNG elareneg ocilbbup led aznecl al erallortnoC :5 petS .erappa ehc etnetu tnuocca'led ollortnoc id artsenif allen ~As odnanoizeles ovitospisid li eracifidom id ppa'la tnesnoc :4 petS.erotallatsni l'eraivna rep elif hus cilc oipod iaf e daolnwod led enoizisop alla iav A :3 petsrellatsni tig avva e tcartkE .eratelpmoc id daolnwod li ertnesnoc e swodniw id enoizarrugifnoc al rep tib 46 a tig us cilc iaf :2 petsmoc.mcs-tig// :spth :elaicifu beW otis la iav :1 petSdaolnwodswodniw us tig erallatsni e eractracs rep iggassap ,osssets ol rep oigpassap li erednerppa id etnesnoc .elaicifu otis ous lad olractracs "A swodniw id odnamoc id agir allus tig erallatsni e eractracs rep eroilgim odom li ,maet isrevid ni ittegorp j erarotinom rep atazillitu utmemumoc eniv ehc erawftos led oiggarotinom id enoizacilppa nu id atart is ,etnemlatnemadnoF .aznecliffo de Aticolev noc inoismemid el otuit id ittegorp eritseg rep otattegorp otutarg e eruos-nepo enoisrev alled ollortnoc id ametsis nu "A HG olocitra'l emoc olocitra'l avlas ,olocitra'l onaroligim enoissucid al azzilausV xfavaJ inoizacilppa eL .jenoizatnemireps(etarugifnocofus inoizarrufni acifirev id inoizacifirev e tmemurtS raB rengisraj .rotareneG butS e C cA haveJ erotareneG .PLNJ inoizacilppa el rep tratS beW swavaj id rehcuoL .imonotua inoizacilppa id eldnub erareneg eAegakcapj)elatnemireps(onemurtS sisyLaN paeh avaj eAtahj.lehs odnamoc id agir-tpirCS tpirCSnurj tpirCSnurj arurturtS tpirCSnurj eAtpirCSnurj eAtpirCSnurj jelatnemireps(nomead tatSJ eAdtatSJ ,erotsyek led enoizalopinam id otmemurts oL .eAlootyek ,avaj-ot-Idi eAj)di erotalipmoc ,raj elif id ititilnoc i eravelir rep Atilitu id otmemurtS on Next. Pass 8: The installation program asks you to create a folder of the Start menu. Just click Next. Pass 9: Choose the text editor you want to use with GIT and click Next. Pass 10: 10: Next step allows you to give your original branch a new name. â € masterâ € " is default. Leave the predefined choice selected and press the Next button. Step 11: it is possible to adjust the Path environment during this installation phase. When performing a command from the command line, the path is the default set of folders that are included. Continue selecting the central (recommended) option and click Next. Step 12: The following option concerns the server certificates. The default choice is used by the majority of users. Just click on Next.step 13: this step deals with how the data is structured, and modify this option can create problems. Therefore, it is recommended to leave the default selection. Step 14: Select the terminal emulator you want to use. Due to its characteristics, the default minity is suggested. Click Next.step 15: the installation program now requires to specify what the GIT Pull command should perform. Leave the selected default option and click Next. Passo 16: the next step is to decide as a credential helper to take. Credential Helper are used by GIT to recover or save credentials. Leave the default selection and click Next. Step 17: Although the default choices are suggested, this step allows you to select which additional functions to be activated. Step 18: Git offers to install some experimental functionalities. Leave them uncontrolled and click on Install. Step 19: Once the installation is completed, launch the Bash Shell.
